## Адаптер для микропипеток МРА

### Capillary sample

The micropipette adapter (MPA) method, based on a simple finger-stick sample taken directly from the patient, is an exclusive feature in hematology analyzers today.

**Especially suited for children and blood banks**

As a finger-stick is largely painless, the MPA is a suitable way to take and analyze blood samples from children or other patients. For blood banks, the functionality provides a tool for making fast pre-donation blood cell determinations. It also saves the vein for donation.

## Finger-stick blood is all you need

From the doctor's office and small labs to medium-sized clinical units, Boule hematology analyzer delivers a CBC and a 3-part WBC differential, with accuracy and reliability. The MPA inlet allows a complete blood count from one drop of blood in a minute.

## MPA adapter – 20 $\mu$ L blood is all it takes

Draw 20  $\mu$ L blood from a simple finger-stick, slide tube into adapter and insert into the analyzer. The analysis starts automatically. In about one minute, you see the full blood screen on the display. No preparation, no pre-dilution and no vacuum tubes required. It's that simple.

# A complete blood count from one drop of blood

Capillary blood sampling can be an option for patients that are hard to puncture such as elderly. As a fingerstick often is easier on the patient, capillary sampling is typically also used with children and critically ill patients.

When performing a finger stick, there are some things to consider to ensure reliable results with an automated hematology analyzer.

## Ensure a good blood flow

- Warm the sampling site for skin puncture 3–5 min.
- Keep the hand in a low, relaxed position to ensure a good blood flow
- Disinfect the sampling area and let air dry.

## Perform the puncture

- Take a firm grip of the whole hand, not just one finger.
- Puncture using a 2 mm lancet and apply a light pressure, then release to obtain a free flow.

*Note! Pressing too hard will cause tissue fluid to dilute the sample, resulting in falsely low results.*

## Collect the blood sample

- Wipe off the first drop of blood with a clean tissue.
- When second drop forms, collect in micropipette.
- Completely fill the micropipette and make sure there is no air trapped inside.
- Carefully wipe off any blood on the outside of the micropipette.

## Analyze

- Insert filled micropipette into the MPA adapter.
- Insert the adapter into the analyzer, and analysis cycle will automatically begin.

*Note! Samples should be analyzed directly after collection, and for optimal results, no longer than 10 min from collection.*

## Read the result

- The results are displayed within one minute.
